The method comprises: (a) reacting a serum sample with a hetr peptide antigen; and (b) examining the peptide for the presence of bound Ab, where the presence of bound Ab indicates the presence of HEV Ab. The present sequence represents the protein from the open reading frame, ORF2, from HEV Mexico strain. The method can be used to diagnose infection with the enterically transmitted non-A/non-B viral hepatitis agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1801
```

```
The sequence is that of the putative virus capsid protein encoded by Mexico strain hepatitis B virus (HEV) open reading frame ORF2. This protein or peptide fragments of it may be used in a vaccine composition for immunising an individual against HEV. Antibodies raised against these peptides can also be used in such vaccines. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CCCTTTGCCCCCAGACGTTGCCGCTGCGTCCGGGTCTGGACCTCGCCTTCGCCAACCAGCC 240

diagnosis, prevention and treatment of hepatitis E virus infection mammals, particularly humans. 

English 3A; 70pp; Example 1; Fig

This invention describes a swine hepatitis B virus (HEV) and its natural mutants which are capable of cross-reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine AHV can also be used for the production of strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled betweethermine. contamination

                                                                                                                                                                   The putative capsid protein (AAR96090) of hepatitis E virus (HEV) Mexico strain is encoded by ORF-2 (AAT27108) of the virus. PCR amplification of ORF-2 allows prodn. of capsid protein or of C-terminal regions of the capsid protein (see also AAR96092, AAR96094 and AAR96096) and expression in Spodoptera frugiperda Sf9 insect cells using a baculovirus vector provides recombinant C-terminal regions (see also AAR96102 and AAR96104) useful as diagnostic reagents and in vaccines. The HEV Burma strain capsid protein (AAR96089) may similarly be used. (Updated on 16-OCT-2003 to standardise OS field)

```
62K antigen (AAR96092) comprises the C-terminal 549 amino acids of hepatitis E virus (HEV) Mexico strain capsid protein (see also AAR96090). It is obtd. by PCR amplification of HEV Mexico ORF-2 (AAR72108), insertion of amplified DMA (AAR72110) into vector polex and expression in E. coli cells. Expression of full-length ORF-2 in 5f9 insect cells using a baculovirus system also results in prodn. of 62K antigen (see also AAR96104). 62K represents an improved antigen, in comparison to bacterial expressed proteins, for use in HEV diagnostic assays, and also has excellent immunogenic properties. High levels of expression were obtd. and the recombinant 62K was obtd. in over 95% purity. However, C-terminal processing resulted in the deletion of 9 or 23 amino acids from 62K, giving 2 related polypeptide species (AAR96102 and AAR96104). Similar results were obtd. with HEV Burma 62K antigen (see also AAR96101 and AAR96103). Recombinant 62K represents an improved antigen, in comparison to bacterial expressed proteins, for use in HEV diagnostic assays, and also has excellent immunogenic properties. (Updated on 16-OCT-2003 to standardise OS field)

```
DNA (AAT27110) coding for the 62K antigen (AAR96092) of hepatitis E virus (HEV) Mexico strain capsid protein was cloned into baculovirus expression vector pBluBacIII and recombinant 62K was expressed in 549 insect cells. High levels of expression were obtd. and the recombinant 62K was obtd. in over 95% purity. However, C-terminal processing resulted in the deletion of 9 or 23 amino acids from 62K, giving 2 related polypeptide species (AAR96102 and AAR96101 and AAR96103). Recombinant 62K burna 62K antigen (see also AAR96101 and AAR96103). Recombinant 62K represents an improved antigen, in comparison to bacterial expressed proteins, for use in HEV diagnostic assays, and also has excellent immunogenic properties. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                     Hepatitis E virus (HEV) antigens derived from ORF 2 - useful as diagnostic reagents for determining HEV infection and in vaccines.
                                                                                       Zhang Y;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SG3 antigen (AAR96094) comprises the C-terminal 327 amino acids of hepatitis E virus (HEV) Mexico strain capsid protein (see also AAR96090). It is obtd. inserting encoding DNA (AAT27112) into pBluescript and ligating the cloned insert into vector pGEX for prodn. of SG3 in E. colicells. SG3 shows low antigenicity compared with capsid 62K antigen (see also AAR96019-22 and AAR96101-04) from HEV Burma and Mexico strains that are produced using a baculovirus expression system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                   A method has been developed for detecting hepatitis E virus (HEV) antibodies (Ab). The method comprises: (a) reacting a serum sample with HEV peptide antigen, and (b) examining the peptide for the presence of bound Ab, where the presence of bound Ab indicates the presence of HEV Ab. The present sequence represents a specifically claimed HEV peptide antigen. The method can be used to diagnose infection with the enterically transmitted non-A/non-B viral hepatitis agent HEV, specifically the HEV Burma and Mexico strains. Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids encoding it - useful for more accurate detection of HEV in samples, using immuno-assays and nucleic acid hybridisation.
                                                                                                   This sequence represents a Hepatitis E viral hollow particle protein described as ORF2. This polypeptide can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptide and nucleic acid allow more accurate detection of HEV than previously possible

                                                                                                                                             ઠે
                                                                                                                                                                      g
                                                                                                                                                                                                                                   The present invention relates to an isolated avian hepatitis E virus having the nucleic acid sequence shown in ABT05872. Vaccines against the virus are also described, and can be used for protecting an avian or mammalian species from viral infection or hepatitis-splenomegaly syndrome caused by the avian or mammalian HEV. The present sequence is a hepatitis E virus protein described in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                          The present sequence is the protein prod, of ORF-2 from the hepatitis E virus (HEV) strain SAR-55, which was implicated in an enterically transmitted non-A, non-B hepatitis in Pakistara. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the detection of HEV antibodies (pref. 1gG or 1gM) in blood, plasma, sera, cerebrospinal fluid, tissue, urine or pleural fluid. The protein, and anti-HEV antibodies generated using the protein, can also be used in vaccines for immunising an animal against HEV infection. The protein is identified as a band of greater than 50 kD following SDS-PAGE of cell lysates of insect cells infected with a HEV ORF-2 contg. Daculovirus, i.e. the claimed recombinant expression vectors pPIC9-1779, -1780 and -1781

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids encoding it - useful for more accurate detection of HEV in samples, using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          223
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a Hepatitis E viral hollow particle protein. This polypeptide can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than previously possible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               490 CTGCCGCTGCAGGACGGTACTAATACTCACATTATGGCCACAGAGGCCTCCAATTATGCA

  -i- FUNCTION: This protein is a component of the acetyl coenzyme A carboxylase complex; first, biotin carboxylase catalyzes the carboxylation of the carrier protein and then the transcarboxylase transfers the carboxyl group to form malonyl-CoA (By similarity).

-:- CATALYTIC ACTIVITY: Carboxybiotin carboxyl carrier protein + machyl-CoA.

-:- PATHMAY: Long-chain carboxyl carrier protein + malonyl-CoA.

-:- SUBUNIT: ACETYL-COA CARBOXYLASE IS AN HETEROHEXAMER OF BIOTIN
   CARBOXYL CARRIER PROTEIN, BIOTIN CARBOXYLASE AND THE TWO SUBUNITS OF CARBOXYL TRANSFERASE IN A 2:2 COMPLEX (BY SIMILARITY). SIMILARITY: TO THE C-TERMINUS OF MAMMALIAN PROPIONYL-COA
